Office Action Summary

Application No.

09/605,610

Applicant(s)

SCHMIDL ET AL.

Examiner

Anh-Vu H. Ly

Art Unit

2667

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 04 November 2005.
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-56 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 1-4, 6-9, 11-24, 26-29 and 31-56 is/are rejected.
7) ☒ Claim(s) 5, 10, 25 and 30 is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

Response to Amendment

1. This communication is in response to applicant's amendment filed November 04, 2005.
Claims 1-56 are pending.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-4, 6-9, 11-14, 21-24, 26-29, 31-34, and 39-56 are rejected under 35 U.S.C. 102(b) as being anticipated by Silventoinen, M. et al (WO 98/07291).

With respect to claims 1 and 21, Silventoinen discloses a wireless communication system (Fig. 1) comprising transmitter circuitry comprising circuitry from transmitting a plurality of frames to a receiver in a first cell (Fig. 3); wherein each of the plurality of frames comprises a bit group (Fig. 2, a normal burst); wherein the bit group uniquely distinguishes the first cell from a second cell adjacent the first cell (Fig. 2, herein, the normal burst is used for communicating information between the base station and its associated mobile stations in only a particular cell, therefore, the burst is distinguished from another burst in another cell); wherein the transmitter circuitry further comprises circuitry for inserting a bit sequence into the bit group (Fig. 2, TS 204); and wherein the bit sequence is selected from a plurality of bit sequences such that

successive transmissions by the transmitter circuitry comprising a cycle of successive ones of the plurality of bit sequences (page 8, lines 1-17).

With respect to claims 2, 22, 11, 31, 42 and 51, Silventoinen discloses each frame of the sequence of frames comprises a midamble and wherein each midamble comprises one of the K different bit sequences (Fig. 2, TS 204).

With respect to claims 3, 6-8, 11, 13, 23, 26-28, 31, 33, 43-44 and 52-53, Silventoinen discloses that K is two and/or four (page 7, line 31) and wherein the transmitter circuitry comprises a CDMA transmitter circuitry (Fig. 3).

With respect to claims 4, 9, 12, 24, 29, 32, 45 and 54, Silventoinen discloses that each frame of the sequence of frames has a corresponding system frame number and wherein each of the K different bit sequences is selected in response to the system frame number (page 7, lines 23-34).

With respect to claims 14 and 34, Silventoinen discloses that wherein the transmitter circuitry comprises TDMA transmitter circuitry (Fig. 3).

With respect to claims 39 and 48, Silventoinen discloses selecting a sequence of K different bit sequences that uniquely distinguish a first cell from a second cell adjacent the first cell (page 8, line 2); inserting the sequence of K different bit sequences into a group of K

Art Unit: 2667

respective sequential frames of the sequence of frames (page 8, lines 5-6); and repeating the step of inserting at each successive group of K sequential frames of the sequence of frames (page 8, lines 6-7).

With respect to claims 40 and 49, Silventoinen discloses that wherein each frame of the sequence of frames comprises a data packet (Fig. 2).

With respect to claims 41 and 50, Silventoinen discloses that each frame of the sequence of frames comprises a voice packet (Fig. 2 discloses a voice packet of the cellular communication system, illustrated in Fig. 1).

With respect to claims 46-47 and 55-56, Silventoinen discloses that each frame of the sequence of frames is a CDMA frame and/or TDMA frame (Fig. 2).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 15-16 and 35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Silventoinen (WO 98/07291) in view of Fazel et al (US Patent No. 6,275,506 B1).

With respect to claims 15-16 and 35, Silventoinen discloses a digital radio system (Fig. 1). Silventoinen does not disclose that the receiver comprising circuitry for identifying paths in plurality of frames as actual paths in response to a comparison of path positions resulting from successive correlation measures between successive ones of plurality of bit sequences in the cycle and bit group in each of plurality of frames and from frames having a like chip position. Fazel discloses (col. 11, lines 25-35) a method of correlating the received midamble information with known symbols, to produce channel state information (path identification and chip position). It would have been obvious to one having ordinary skill in the art at the time the invention was made to include the features of correlating the received midamble information with known symbols in Silventoinen's system, as suggested by Fazel, for producing channel station information.

4. Claims 15-20, 35, and 37-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Silventoinen (WO 98/07291) in view of Klank (US Patent No. 6,690,658 B1).

With respect to claims 15-16 and 35, Silventoinen discloses a digital radio system (Fig. 1). Silventoinen does not disclose receiver comprising circuitry for identifying paths in plurality of frames from successive correlation measures between successive ones of plurality of bit sequences in the cycle and bit group in each of plurality of frames and from frames having a like chip position. Klank discloses (col. 15, lines 10-28) that in order to check the cluster identity (cell identification), the corresponding section of the control slot signal has to be demodulated, decoded, and compared with own cluster identity. A correlation with a sequence in accordance with the identity number can be made. Depending on the results and midamble correlation

Art Unit: 2667

result, this yields different statements: Identity check positive, midambles: signals of their own cluster (chip like position); Identity check negative but midambles: signals of another cluster; Result negative, no midambles but some power may be sporadic interference. It would have been obvious to one having ordinary skill in the art at the time the invention was made to include the feature of correlating midamble information in Silventoinen's system, as suggested by Klank, for identifying the actual paths in a cluster.

With respect to claims 17-18 and 37-38, Silventoinen discloses a wireless communication system (Fig. 1) comprising receiver circuitry comprising circuitry for receiving a plurality of frames from a transmitter in a first cell (Fig. 4); wherein each of the plurality of frames comprises a bit group (Fig. 2, a burst) having a bit sequence (Fig. 2, TS field); wherein the bit group uniquely distinguishes the first cell from a second cell adjacent the first cell (Fig. 2, herein, the normal burst is used for communicating information between the base station and its associated mobile stations in only a particular cell, therefore, the burst is distinguished from another burst in another cell). Silventoinen does not disclose the receiver further comprises circuitry for identifying paths in plurality of frames as actual paths in response to a comparison of path positions resulting from successive correlation measures between successive ones of plurality of bit sequences in a cycle and bit group in each of plurality of frames and from frames having a like chip position. Klank discloses (col. 15, lines 10-28) that in order to check the cluster identity (cell identification), the corresponding section of the control slot signal has to be demodulated, decoded, and compared with own cluster identity. A correlation with a sequence in accordance with the identity number can be made. Depending on the results and midamble

Art Unit: 2667

correlation result, this yields different statements: Identity check positive, midambles: signals of their own cluster (chip like position); Identity check negative but midambles: signals of another cluster; Result negative, no midambles but some power may be sporadic interference. It would have been obvious to one having ordinary skill in the art at the time the invention was made to include the feature of correlating midamble information in Silventoinen's system, as suggested by Klank, for identifying the actual paths in a cluster.

With respect to claim 19, Silventoinen discloses each frame of the sequence of frames comprises a midamble (Fig. 2, TS 204) and wherein each midamble comprises the bit group (Fig. 2).

With respect to claim 20, Silventoinen discloses that K is two and/or four (page 7, line 31) and wherein the transmitter circuitry comprises a CDMA transmitter circuitry (Fig. 3).

5. Claim 36 is rejected under 35 U.S.C. 103(a) as being unpatentable over Silventoinen (WO 98/07291) in view of Alamouti et al (US Pub No. 2003/0219080 A1).

With respect to claim 36, Silventoinen discloses a digital radio system (Fig. 1). Silventoinen does not disclose applying channel estimates corresponding to actual paths to a maximal ratio combiner circuit. Alamouti discloses in Figs. 1, 3, and 4, wherein the outputs of channel estimator are fed into the combiner. It would have been obvious to one having ordinary skill in the art at the time the invention was made to include a combiner in Silventoinen's system, as suggested by Alamouti, to detect the a reliable signal from a plurality of received signals.

Allowable Subject Matter

6. Claims 5, 10, 25, and 30 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Response to Arguments

7. Applicant's arguments filed November 04, 2005 have been fully considered but they are not persuasive.

Applicant argues in page 10 that Silventoinen fails to disclose that the training sequence uniquely distinguishes one cell from another.

Examiner respectfully disagrees. First of all, as recited in independent claim 1, “wherein each of the plurality of frames comprises a bit group” and “wherein the bit group uniquely distinguish the first cell from a second cell adjacent the first cell”; herein, the bit group or a burst (Fig. 2) distinguishes one cell from another, but not the training sequence. The training sequence only occupies a number of bits in the bit group and it is not the bit group. Therefore, applicant’s argument is not directed to the claimed invention. Further, as illustrated in Fig. 2, a burst or the bit group of data for communicating between the base station and its associated mobile stations in a particular cell. Therefore, the burst or the bit group, herein, is different from other bursts or bit groups from other adjacent cells, since they carry information between different base stations and different mobile stations. Therefore, Silventoinen addresses all the claimed limitations.

Conclusion

8. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Anh-Vu H. Ly whose telephone number is 571-272-3175. The examiner can normally be reached on Monday-Friday 7:00am - 4:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chi Pham can be reached on 571-272-3179. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
